

IN THE CLAIMS:

The text of all pending claims, (including withdrawn claims) is set forth below. Cancelled and not entered claims are indicated with claim number and status only. The claims as listed below show added text with underlining and deleted text with ~~striketrough~~. When strikethrough cannot easily be perceived, or when five or fewer characters are deleted, [[double brackets]] are used to show the deletion. The status of each claim is indicated with one of (original), (currently amended), (cancelled), (withdrawn), (new), (previously presented), or (not entered). Please AMEND claim 9 and ADD claims 17, 18, and 19 in accordance with the following:

1. (Previously Presented) An information-processing device that executes a specific process more frequently than other processes among a variety of processes, said information-processing device comprising:

a first processor capable of executing an instruction set corresponding to the variety of processes; and

a second processor capable of executing a portion of or the entire instruction set, said second processor being capable of executing a part of said instruction set corresponding to the specific process more efficiently than said first processor,

wherein said second processor executes the specific process whereas said first processor executes the other processes, and each process is comprised of a series of instructions, the first processor and the second processor being configured such that a series of instructions executed by the first processor is separate from and independent of a series of instructions executed by the second processor.

2. (Previously Presented) The information-processing device as claimed in claim 1, wherein all the processes are allocated to said second processor initially, wherein said second processor passes a given process to said first processor by interrupting said first processor in a case in which an instruction other than the part of the instruction set corresponding to the specific process must be executed.

3. (Previously Presented) The information-processing device as claimed in claim 1, wherein all the processes are allocated to said second processor initially, wherein said second processor passes a given process to said first processor by interrupting said first processor when an instruction that cannot be executed or cannot be efficiently executed by said second processor appears in said given process.

4. (Previously Presented) The information-processing device as claimed in claim 3, wherein said instruction that cannot be executed or cannot be efficiently executed by said second processor is a floating-point arithmetic operation.

5. (Previously Presented) The information-processing device as claimed in claim 1, wherein said second processor is capable of executing the part of said instruction set corresponding to the specific process more efficiently than said first processor by executing said specific process in parallel by use of at least one of a multi-threading method and a multi-processing method.

6. (Previously Presented) The information-processing device as claimed in claim 1, wherein said first processor is a general-purpose processor, wherein said second processor is a transaction processor designed to efficiently execute a transaction process as the specific process.

7. (Previously Presented) The information-processing device as claimed in claim 1, wherein said first processor and said second processor share a memory space.

8. (Previously Presented) The information-processing device as claimed in claim 1, wherein said information-processing device includes a plurality of first processors and second processors.

9. (Currently Amended) An information-processing device that executes a specific process more frequently than other processes among a variety of processes, said information-processing device comprising:

a first processor capable of executing an instruction set and designed to execute variety of processes; and

a second processor capable of executing a portion of or the entire instruction set, said second processor being capable of executing multiples of specific processes concurrently and ~~achieving~~achieving more efficient execution than said first processor,

wherein said second processor executes the specific process whereas said first processor executes the other processes, and each process is comprised of a series of instructions, the first processor and the second processor being configured such that a series of instructions executed by the first processor is separate from and independent of a series of

instructions executed by the second processor.

10. (Previously Presented) The information-processing device as claimed in claim 9, wherein all the processes are allocated to said second processor initially, wherein said second processor passes a given process to said first processor in a case in which an instruction other than the part of the instruction set corresponding to the specific process must be executed.

11. (Previously Presented) The information-processing device as claimed in claim 9, wherein all the processes are allocated to said second processor initially, wherein said second processor passes a given process to said first processor when an instruction that cannot be executed appears or the execution of the process is judged not by said second processor in said given process.

12. (Previously Presented) The information-processing device as claimed in claim 11, wherein said instruction that cannot be executed or cannot be efficiently executed by said second processor is a floating-point arithmetic operation.

13. (Previously Presented) The information-processing device as claimed in claim 9, wherein said second processor is capable of executing all or the part of said instruction set corresponding to the specific process more efficiently than said first processor by executing said specific processes in parallel by use of at least one of a multi-threading method and a multi-processing method.

14. (Previously Presented) The information-processing device as claimed in claim 9, wherein said first processor is a general-purpose processor, wherein said second processor is a transaction processor designed to efficiently execute a transaction process as the specific process.

15. (Previously Presented) The information-processing device as claimed in claim 9, wherein said first processor and said second processor share common memory address space.

16. (Previously Presented) The information-processing device as claimed in claim 9, wherein said information-processing device includes a plurality of first processors and second processors.

17. (New) An information-processing device that executes a specific process more frequently than the other processes among a variety of processes, said information processing device comprising:

a first processor capable of executing an instruction set corresponding to the variety of processes; and

a second processor capable of executing a portion of or the entire instruction set, said second processor being capable of executing a part of said instruction set corresponding to the specific process more efficiently than said first processor,

wherein said second processor executes the specific process whereas said first process executes the other processes, and all the processes are allocated to said second processor initially, wherein said second processor passes a given process to said first processor by interrupting said first processor when an instruction that cannot be executed or cannot be efficiently executed by said second processor appears in said given process.

18. (New) The information-processing device as claimed in claim 17, wherein said instruction that cannot be executed or cannot be efficiently executed by said second processor is a floating-point arithmetic operation.

19. (New) An information-processing device that executes a specific process more frequently than other processes among a variety of processes, said information device comprising:

a first processor capable of executing an instruction set and designed to execute variety of processes; and

a second processor capable of executing a portion of or the entire instruction set, said second processor being capable of executing multiples of specific processes concurrently and achieving more efficient execution than said first processor,

wherein said second processor executes the specific process whereas said first processor executes the other processes, and all the processes are allocated to said second processor initially, wherein said second processor passes a given process to said first processor when an instruction that cannot be executed appears or the execution of the process is judged not by said second processor in said given process, and said instruction that cannot be executed or cannot be efficiently executed by said second processor is a floating-point arithmetic operation.
